

Market Design for Land Trade

Gharad Bryan, Jonathan de Quidt, Mariajose Silva Vargas, Tom Wilkenning and
Nitin Yada

May 14, 2024

Motivation

Farms in low income countries are

- A. Small
- B. Fragmented
- C. Misallocated (Adamopoulos/Restuccia, Gollin/Udry, Casaburi/Wills)

It is likely that

- ▶ $A + B + C \rightarrow$ low productivity
- ▶ Between 20 & 300% gain in productivity from reallocation
- ▶ Maybe 70% gain from move to optimal size (Foster/Rosenzweig)

Motivation: Example

Kisoro District, Uganda

This Paper - Aim

What can/should be done?

- ▶ Many constraints to land trade - e.g., property rights, culture
- ▶ We argue, even if these are fixed, **market design** is important to reach efficiency
 - ▶ Consistent with existing lit: Bleakly/Ferrie, Milgrom, Deininger/Goldstein/La Ferrara
 - ▶ Consistent with **top down** practice, e.g., land consolidation, FAO etc.
- ▶ Potentially a better solution than top down
 - ▶ Environment has low information, low state capacity, potential coercion
 - ▶ Markets are voluntary, participatory, and (can be) within community

This Paper - Specifics

Specifically we use surveys and lab in the field experiments to show

1. Farmers believe the environment has characteristics predicted to impede trade
2. Even with perfect institutions, decentralized trade is far from efficient
3. Market designs tailored to the setting can improve efficiency

(Approach design problem as “Economist as Engineer” - Roth)

A Representation of The Trading Problem

4 Key Properties

- ▶ **Consolidation:** contiguous farms more profitable
- ▶ **Sorting:** Better farmers should farm best land
- ▶ **DRS:** at farm level
- ▶ **Culture:** Some plots not for sale at any price

+ private information

An initial allocation (A)

	10		11	11	16	6	
15	12	12		9	17	17	7
4	15	9	12	9			8
8		8			13	5	
5	1	10	17	2	6	2	6
1	1	4		16	14		4
3	3		18	15	13	18	
16	18	2			7	3	10
		13	11	14	14	5	7

An efficient allocation (B)

	13		18	18	17	17	
15	13	13		18	17	14	14
15	15	16	16	16			14
8		10			11	11	
8	12	10	10	9	11	7	7
8	12	12		9	9		7
3	3		1	1	1	4	
3	2	2			4	4	5
		2	6	6	6	5	5

Goal is to get from A to B. Will show, consistent with farmers' own beliefs

A Representation: Why is Land Trade Hard?

Three Problems

1. Thin markets:

- ▶ Myerson & Satterthwaite (1983)

2. Exposure risk:

- ▶ Goeree & Lindsay (2020)

3. Coordination frictions:

- ▶ Milgrom (2017)

+ Liquidity constraints exacerbate

Farmer 17 wants 3 contiguous plots

	10		11	11	16	6	
15	12	12		9	17	17	7
4	15	9	12	9			8

A Representation: How Can Market Design Help?

Three Goals

1. Thicken markets

- ▶ e.g., get people in the same room

2. Enforce Contracts

- ▶ e.g., allow conditional contracts

3. Find Chains

- ▶ e.g., estate agent

Farmer 17 wants 3 contiguous plots

	10		11	11	16	6	
15	12	12		9	17	17	7
4	15	9	12	9			8

A Representation: How Can Market Design Help?

An important tradeoff: Generic \iff Tailored

In theory tailoring helps

- ▶ Generic centralization
 - ▶ e.g., trade fair
 - ▶ may do something
- ▶ Tailored design
 - ▶ e.g., spectrum auctions
 - ▶ specifically designed for setting

But, tailored designs are complicated

- ▶ A problem in our setting
- ▶ Why we take a lab in field approach
- ▶ Economist as Engineer (Roth)

Farmer 17 wants 3 contiguous plots

	10		11	11	16	6	
15	12	12		9	17	17	7
4	15	9	12	9			8

Road Map

I am going to answer three questions

1. Is our representation any good?
 - ▶ Yes, Ugandan small holder farmers agree with it
2. Is decentralized trade really inefficient?
 - ▶ Yes, given a week to trade on our maps, efficiency is very low
 - ▶ In contrast to high efficiency in more typical trading games
3. Does market design help?
 - ▶ Generic centralization improves outcomes
 - ▶ Highly tailored auction does best, despite complexity

Conclusion: Market design is important, and can work in our setting

Question 1: Is Our Representation Any Good?

The Survey

1,404 land-owning farmers in Masaka, Uganda (mostly coffee, maize, beans)

- ▶ Screened on interest in playing trading games over 3 weeks.
- ▶ Similar on observables to same-region LSMS.

Active in the land market:

- ▶ 10% bought/sold, 20% rented in/out in last 12 months.
- ▶ 45% of cultivated land acquired on the market.

⇒ institutions are good enough to support trade

- ▶ But, 64% have fragmented farms. 20–40 mins walk between plots

Characteristic 1: Do Farmers Believe in Consolidation Gains?

Existing Lit:

- ▶ Costs and benefits of fragmentation long debated
 - ▶ e.g., McCloskey (1972), Foster & Rosenzweig (2017)
- ▶ Technical literature views fragmentation as a problem to be eliminated
 - ▶ e.g., FAO (2003), Hartvigsen (2014)

Our data:

- ▶ 25% tried to consolidate; of which 1/2 succeeded
- ▶ 91% prefer 1×2 acre to 2×1 acre
- ▶ 88% believe consolidation increases profits
- ▶ Average 50% increase from consolidation
- ▶ Most point to travel time & labor management

Characteristic 2: Do Farmers Believe in Sorting Gains?

Existing Lit:

- ▶ Taken as given in the quantitative literature
- ▶ Casaburi/Willis have experimental evidence
- ▶ Gollin/Udry implies complementarity

Our data:

- ▶ 99% think there is ability heterogeneity in the village
- ▶ Guess best farmers produce $\approx 3\times$ worst farmers
- ▶ 99% think there is land quality heterogeneity
- ▶ 99% think ability and quality are complements

Characteristic 3: Do Farmers Believe in DRS?

Existing Lit:

- ▶ Largely taken as given in the quantitative literature
- ▶ Helps rationalize existence of many producers

Our data:

- ▶ 40% think they could not farm more than their current endowment
- ▶ 99% believe there is heterogeneity in ability to manage large farms
 - ▶ Best farmer 5 acres
 - ▶ Worst farmer 3/4 acre

Characteristic 4: Do Farmers Believe in Cultural Constraints?

Existing lit

- ▶ Unclear if taboo, or just some plots

Our data:

- ▶ 65% agree land trade acceptable
- ▶ 90% of households agree that ancestral land should not be sold.
- ▶ 89% would not sell all land and migrate even for “a good price”
- ▶ 69% want their children to be farmers
- ▶ 31% think people should not sell outside the tribe

What about Private Info?

Ability is (partially) observable

- ▶ 98% say “everyone knows who the best farmers are”
- ▶ But many sources of unobservable heterogeneity in WTA/WTP

Important: no concern about adverse selection (lemons)

- ▶ 3% think plot quality is difficult to assess
- ▶ 94% know how to assess quality of others' plots

Question 2: Is Decentralized Trade Efficient?

Experiment 1: Design Overview

Sample:

- ▶ Land-owning farmers
- ▶ 68 villages in Masaka, Uganda

Game:

- ▶ 18 players
- ▶ 3 plots each
- ▶ Paper game currency

Strong monetary incentives:

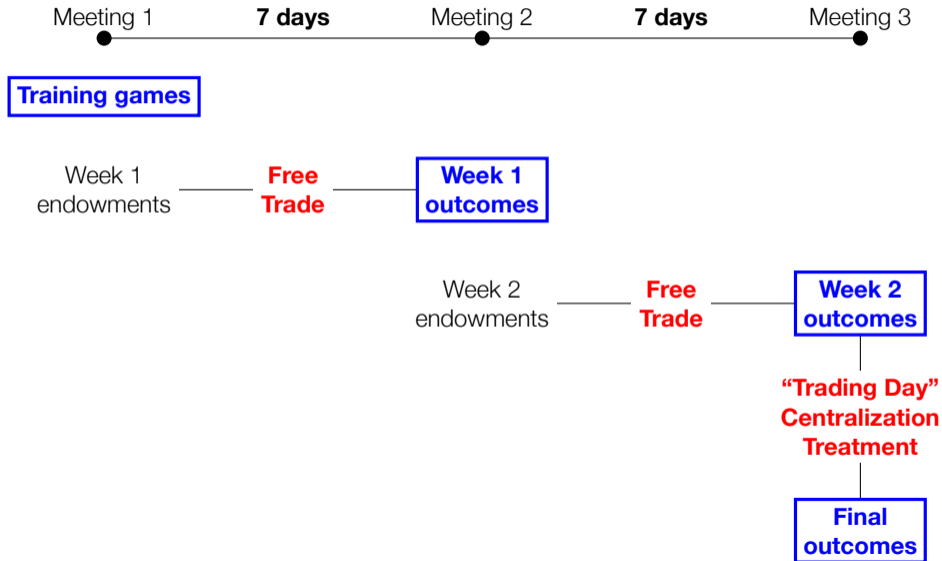

- ▶ 1 day's wage showup fee
- ▶ + up to 2.2 days' wages in trade
- ▶ 57% gains from trade on average

Free-form bargaining over 7 days, twice

Timeline

Analysis

Gains from trade scaled by total potential gains:

$$\text{Efficiency} = \frac{\text{Final welfare} - \text{Initial welfare}}{\text{First best welfare} - \text{Initial welfare}} \leq 1$$

Decomposition:

$$\text{Efficiency} = \text{Consolidation} + \text{Sorting} - \text{“Exposure losses”}$$

Result 1: Land trade is hard

Training games

- ▶ Standard lab market game based on Chamberlin (1948)
- ▶ Market game with multiple “titles” and a max farm size

Land trade game

- ▶ 95% try to buy at least 1 plot
- ▶ 87% succeed
- ▶ Half of plots change hands
- ▶ **Very low efficiency**

Result 2: Some aspects are harder than others

Note: these regressions include week 2 (pre and centralization)

Question 3: Does Market Design Help?

A Generic Design: Market Centralization

A continuation of the previous experiment:

- ▶ After week 2 trade, a *surprise* market centralization intervention: “Trading Day”
- ▶ Everyone comes to the lab, given as much time as needed for additional trade

Centralization should

- ▶ Thicken the market
- ▶ Support enforcement
- ▶ Facilitate finding and bargaining over chains
- ▶ → but is not specifically tailored to the problem

Result 3: Large Efficiency Gains from Centralization

Note: these regressions include week 2 (pre and centralization)

Result 4: Driven by Consolidation and Exposure Gains

Note: these regressions include week 2 (pre and centralization)

A Note on Endogenous Centralization

Subjects try to centralize, but they are not good at it

Note: these regressions include week 2 (pre centralization)

Conjecture: A formal institution is required for coordination

Does Tailoring Help: A Second Experiment

48 sessions with land-owning farmers in
Kiambu county, Kenya

- ▶ Game: 6 participants \times 2 plots each
- ▶ Session: eight 10-minute computerized “land auctions”
- ▶ Incentives: \$3 show-up + \$4 average earnings \approx 1.5 days’ wages

An initial allocation

An efficient allocation

Does Tailoring Help: Interface

Land Auction

Player 1 6 47

You can select either one land to sell or one land to buy.

Type	Single	Adj. Bonus
	400	160
	300	120
	200	80

Current Allocation

 1	 2	 3	 4	400	0
 5	 6	 7	 8	300	0
 9	 10	 11	 12	0	0

Cash: 300
Total Profit: 1000

Alternate Allocation [reset](#)

 1	 2	 3	 4	400	0
 5	 6	 7	 8	300	0
 9	 10	 11	 12	0	0

Cash:
Total Profit: 1000

Submit a Bid

Sell Lots Buy Lots Total Price

Receive (at least)

Pay (at most)

Your current open bids.

Sell Lots	Buy Lots	Price	Current Profit	Expected Profit	Action
No data available in table					

Does Tailoring Help: Mechanisms

Three **continuous double auctions** with varying **package size**

- ▶ CDA-Broker: Buy or sell one plot at a time.
 - ▶ E.g. “Buy plot 3 for at most 300”
- ▶ CDA-Swap: can also bid to buy **and** sell one plot.
 - ▶ E.g. “Buy plot 3 and sell plot 7, pay at most 50”
- ▶ CDA-Package: can also bid to buy **and** sell up to two plots
 - ▶ E.g. “Buy plots 9 and 10, sell plots 2 and 5, receive at least 200”

All treatments:

- ▶ Software searches for implementable trades & sets prices in continuous time.
- ▶ Centralized trade with verbal communication permitted
- ▶ “Bidding assistants” to operate software
- ▶ XOR bids

Inspired by Goeree and Lindsay (2017)

Does Tailoring Help: Mechanisms

Why do auctions help?

- ▶ XOR allows multiple bids
 - ▶ Thickening markets
- ▶ Given inputs, computer finds chains
- ▶ Computer enforces all conditions

Treatments differ in tailoring

- ▶ CDA-package decouples
 - ▶ Initial allocation is irrelevant
- ▶ But, CDA-package is hard to explain/understand
 - ▶ Large set of packages

Result 5: CDA-Broker has High efficiency, mostly from Consolidation

Result 6: Higher efficiency in package mechanisms, sorting gains

Some Additional Results

Additional Results: Inequality

Market design might exacerbate inequality

- ▶ In complex mechanisms: sophisticates might profit at others' expense
- ▶ Compute Atkinson Index of final assets (assuming log utility):

$$I^A = 1 - \exp \left(\sum_i (\ln y_i - \ln \bar{y}) \right)$$

Inequality and Centralization: Uganda

Table VIII: Inequality Experiment 1 (Uganda Decentralized Trade)

	Atkinson Index (log utility)			
	(1) + 5-day wage	(2) + worst score	(3) + show-up fee	(4) rounded
<i>Panel A: Impact of centralization</i>				
Centralization	-0.004*** (0.001)	-0.007*** (0.001)	-0.122*** (0.022)	-0.286*** (0.032)
Control mean	0.012	0.020	0.209	0.522
Observations	136	136	136	136
<i>Panel B: Impact of eliminating nontradable plots</i>				
Simple map	-0.003** (0.001)	-0.011 (0.007)	-0.068* (0.036)	-0.090** (0.043)
Control mean	0.014	0.030	0.237	0.551
Observations	136	136	136	136
<i>Panel C: Impact of centralization and eliminating nontradable plots</i>				
Centralization treatment	-0.005*** (0.001)	-0.008*** (0.002)	-0.146*** (0.031)	-0.304*** (0.042)
Centralization × simple map	0.001 (0.001)	0.002 (0.003)	0.048 (0.044)	0.036 (0.064)
Control mean	0.013	0.023	0.255	0.582
Observations	136	136	136	136

Inequality and Packages: Kenya

Table X: Inequality in Experiment 2 (Kenya Package Exchanges)

	Atkinson Index (log utility)		
	(1) High cash	(2) Low cash	(3) High & Low
Package-2	0.0004 (0.0006)	-0.0031*** (0.0011)	0.0004 (0.0006)
Package-4	-0.0002 (0.0006)	-0.0019* (0.0010)	-0.0002 (0.0006)
Package-2 × low cash			-0.0035*** (0.0011)
Package-4 × low cash			-0.0017 (0.0010)
F-test p-value: all low cash effects = 0			0.006
Control mean	0.012	0.035	0.024
Observations	159	159	318

Additional results: Culture, Liquidity and Communication

Non-tradable plots (cultural constraints)

- ▶ Uganda randomized “Complex” maps, and “Simple” maps
- ▶ Hardly matters for efficiency, but exacerbates inequality (more holdout?)

Liquidity constraints

- ▶ Experiment 2 randomized initial cash balances (Low vs High)
- ▶ No efficiency effect
- ▶ But exacerbates inequality when packages not available

Role of communication

- ▶ We allow verbal communication in all treatments.
- ▶ Package exchange seems to crowd out verbal bargaining

Summary

We have four main points

1. Land trade is hard, even with good institutions
2. Simple centralization can help, a little
3. More tailoring improves outcomes
4. Market design can work, in a difficult setting

We also show, if anything, our market design interventions reduce inequality

- ▶ Very important given our setting
